Station Paper No. 20 April 1950

COMMODITY DRAIN FROM FORESTS OF THE LAKE STATES - 1948

By Arthur G. Horn, Forest Economist 2/

INTRODUCTION

Shortly after World War II, a field survey was initiated to determine more accurately the forest resource facts of the Lake States region. Collection and compilation of timber drain statistics was one of several important phases of this survey. As a means of determining the annual drain, the Station obtains annual or periodic reports for the principal forest industries, covering, in some cases, the year's production of finished products; in other cases, the receipts of sawlogs and bolts at the plants. From these the Station computes commodity drain, that is, the amount of live merchantable timber removed through cutting including logging waste during the year.

Frequent requests for production and drain data resulting from the survey are received. To more effectively meet these demands, we have prepared this publication giving Lake States production and drain figures for 1948. Similar reports for 1946 and 1947 are available on request. In using the data, it is important to keep in mind the standards and definitions used in compiling the information. (See definitions.)

Basis for Production Statistics

Since lumber production figures were not reported by the Bureau of the Census for 1948, the Station prepared an estimate based on comparison of 1946-1948 output of larger mills. To further strengthen this estimate, a spot-check of railroad carloadings for 1946, 1947, and 1948 was made at several of the general offices of railroad companies. This was supplemented by a canvass of mills adjacent to state boundaries to determine interstate movement of sawlogs.

For veneer, pulp distillation, excelsior, and cooperage industries, a complete canvass was made of all known plants early in 1949. The volume of logs and bolts received at these plants during the calendar year was used as a basis for production estimates.

1/ Maintained at University Farm, St. Paul, Minnesota, in cooperation with the University of Minnesota.

2/ The author gratefully acknowledges the assistance provided in some of the field work by J. R. Neetzel, H. L. Heinselman, H. H. Seeley, Z. A. Zasada, and W. M. Zillgitt, Foresters, Lake States Forest Experiment Station; and W. W. Barton, Forester, R-9 Regional Office. Acknowledgment is also due to the many owners and operators of wood-using mills and plants in the Lake States region who so kindly cooperated and furnished the basic information so necessary for this report.

Production statistics for such minor items as piling, poles, hewn ties and mine timbers, lagging, etc., were obtained by using results of 1947 survey of these items and comparing with reliable production indexes for 1947-48; i.e., annual underground ore production by states, pole and piling receipts of several large wholesalers and distributors who handle most of the regional output. Because financial limitations precluded making special surveys, estimates for fuelwood, posts, and miscellaneous items were based largely on surveys made during the latter stages of World War II. Some adjustments were made on the basis of more recent findings from wholesalers and distributors.

Conversion Factors

The Station, in conducting production surveys, has collected supplemental information on each product as to percent of wood volume obtained from live, dead, cull trees, and byproduct material; also proportion of volume cut from saw-timber and pole-timber trees. Gross volumes of individual products were determined by information furnished by industry. For example, stock records for posts, poles, and piling showed number of pieces by length, top, and butt diameters. Such information made possible calculations of gross volume for each product. By incorporating these findings with data collected during a previous field survey (1936-37), a set of conversion and waste factors have been made which are closely in line with present utilization standards of wood-using industries.

General Limitations of Data

The forest survey accuracy goal for drain data is ± 5 percent per billion cubic feet, which would permit a standard error of slightly more than 6 percent on the 1948 estimate for the Lake States. Because of absence of an accurate census of lumber and fuelwood for that year, the estimates presented here may not be within that limit. We feel, however, that the estimates are the best obtainable at this time and will serve a very useful purpose. Figures for most products are within the proposed limits. Some adjustments may be made later if better figures for lumber and fuelwood become available.

Survey Definitions

Commodity Production

The gross volume of a forest product produced from any class of material from commercial or noncommercial forest lands. Production has been expressed in the following standard survey units: Board-feet log scale International 1/4-inch rule, feet board measure lumber tally; cord (4x4x8 feet), rough wood basis; number of pieces; and number of cubic feet (inside bark).

Commodity Drain

The net volume of timber removed from growing stock on commercial forest lands through cutting and logging waste during the year, expressed in board feet, International 1/4-inch rule and cubic feet (i.b.).

Drain from Saw-Timber Trees

The net volume (board feet, International 1/4-inch) of the log portion in softwood trees 9 inches and larger and hardwood trees 11 inches and larger, d.b.h., removed or wasted during logging operations. The cubic-foot volume shown includes both the saw-timber equivalent plus the volume in the tops of softwood trees to a 4-inch minimum.

Drain from Pole-Timber Trees

The net volume in cubic feet (i.b.) of pole timber removed through cutting and logging waste during the year. Included in this class are softwood trees from 5.0- to 8.9-inch and hardwood trees from 5.0- to 10.9-inch d.b.h. It includes cubic foot volume found in the tree stems to a minimum top diameter of 4 inches (i.b.).

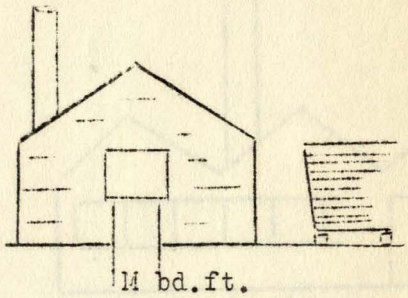
HIGHLIGHTS OF THE COMMODITY DRAIN SURVEY

1948

PRODUCTION OF MAJOR PRODUCTS

Lumber Production

Nearly 1 billion 3 hundred million board feet of lumber was produced in 1948 by 4,000 or more sawmills in the Lake States. This was the largest annual cut since 1930. Michigan accounted for nearly one-half of the total output. Wisconsin was second and Minnesota third with about 34 percent and 18 percent respectively.



M bd.ft.

Lumber tally

Minnesota	240,000
Wisconsin	440,000
Michigan	615,000
Total	1,295,000

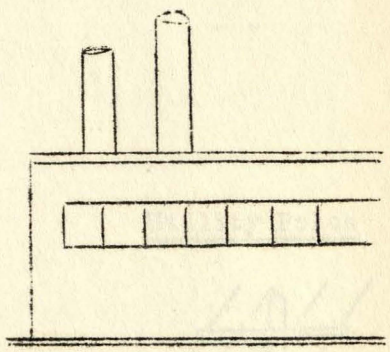
Pulpwood Production

Pulpwood production in 1948 amounted to approximately 2,184,000 standard cords (rough wood basis). This was approximately 8 percent above that of 1947, but was 3 percent less than that of the peak production year 1946.

Wisconsin mills received 1,248,000 cords, about 57 percent of the total pulpwood produced. Minnesota mills took 28 percent and Michigan mills 13 percent. The remaining one or two percent represents pulpwood shipped to mills outside the region.

Canada shipped about 760,000 cords and Montana and Colorado combined sent slightly more than 35,000 cords to Lake States mills.

Total domestic and imported wood receipts for 1948 amounted to nearly 3 million cords.



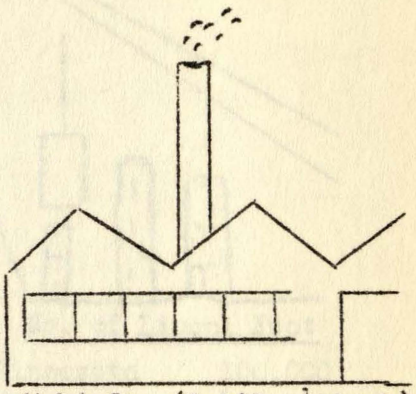
Standard cords (Unpeeled)

Minnesota	987,000
Wisconsin	468,000
Michigan	729,000
Total	2,184,000

Veneer Log Production

Approximately 117 million board feet of veneer logs were cut from Lake States timber and shipped to some 100 or more veneer mills operating in the region. Nearly two-thirds of the logs were produced in Michigan.

Commercial veneer plants, which manufacture mostly high-grade veneers and panels, consumed about 75 percent of the veneer logs produced. The container veneer industry, manufacturing cheese boxes, berry boxes, picnic baskets, fruit and vegetable baskets, hampers, etc., used 25 percent of the logs plus 16,210 cords cut for heading stock.

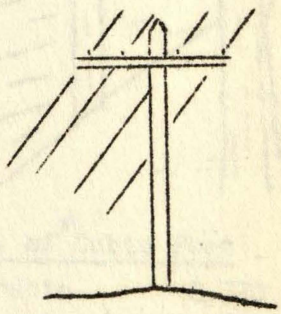


M bd.ft. (Int'l. ¼-inch)	
Minnesota	7,000
Wisconsin	32,000
Michigan	78,000
Total	117,000

Miscellaneous Products

Based on industry reports it is estimated that about 216,000 utility poles were produced in 1948. Although cedar was the principal species cut for poles, considerable jack pine was cut, seasoned, and treated, and used in constructing and maintaining lines in Minnesota and neighboring states.

Utility Poles



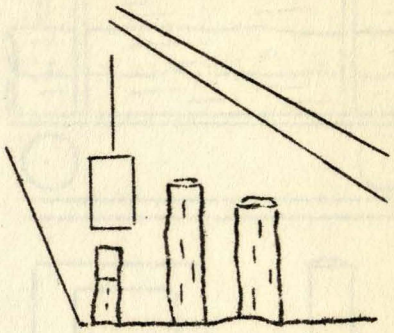
Number of Pieces	
Minnesota	140,000
Wisconsin	16,000
Michigan	60,000
Total	216,000

Minnesota produced most of the northern pine piling and Wisconsin practically all of the hardwood piling in the region. Lake States production was between 10,000 or 11,000 pieces, equivalent to 275,000 lineal feet, which was considerably less than either the 1946 or 1947 output.

Continued heavy mining of Lake States ore has brought about a steady demand for mine timbers, mine poles, lagging, and other timber items. Production of wood for the mines in 1948 amounted to nearly 8 million cubic feet in the region. Of this amount about 3½ million cubic feet was mine timbers, 2¼ million lagging, and another 2¼ million miscellaneous mine products. Tamarack, cedar, and maple were the species most heavily cut for mine materials.

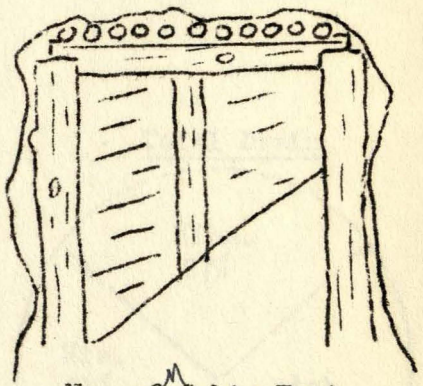
Production of relatively stable products such as fuelwood, fence posts, shingles, lath, and cabin logs, continued at about the same general level as maintained during the past four or five years. Chemical wood, excelsior bolts, and cooperage logs on the other hand dropped to lower levels. In the case of chemical wood the drop amounted to as much as 40 percent over a year or two ago.

Piling



No. of Lineal Feet	
Minnesota	100,000
Wisconsin	175,000
Michigan	-
Total	275,000

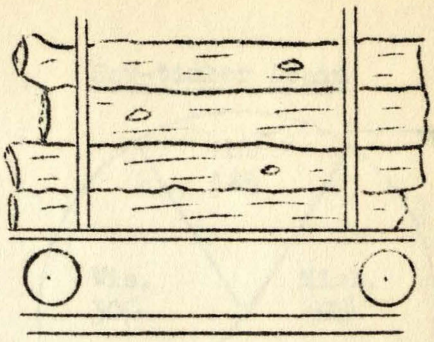
Mining Products

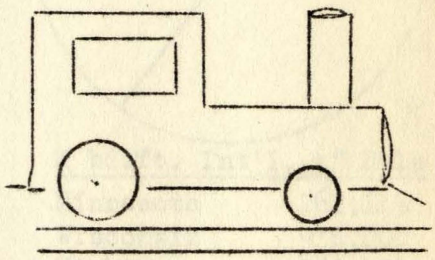


No. of Cubic Feet	
Minnesota	2,770
Wisconsin	390
Michigan	4,460
Total	7,620

Interstate Log Movement

Movement of logs between the three Lake States continued at a rather brisk rate, especially between Michigan and Wisconsin. Logs cut in Michigan and shipped or trucked to Wisconsin's larger sawmills and other primary wood-using plants amounted to nearly 60 million board feet (International 1/4-inch rule) in 1948. Minnesota shipments to Wisconsin, which consisted almost entirely of veneer logs, amounted to a little less than 5 million board feet. Wisconsin in turn, shipped approximately 9½ million feet to Michigan and about 1 million to Minnesota.





~~M~~ bd.ft. (Int'l. ¼-inch)

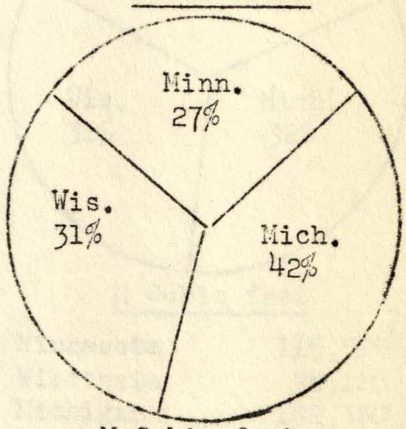
Michigan to Wisconsin:
30 million sawlogs
27 million veneer logs
Minnesota to Wisconsin:
5 million veneer logs
Wisconsin to Michigan:
10 million sawlogs
Wisconsin to Minnesota:
1 million sawlogs

DRAIN

Timber Drain From Cutting

The total commodity drain on Lake States forests during 1948 amounted to approximately 675 million cubic feet. The timber harvest was the largest in years, surpassing 1946 by 6 percent, and 1947 by about 1 percent.

Total Drain



M Cubic feet

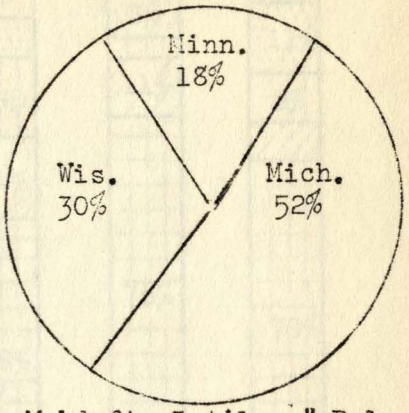
Minnesota	184,590
Wisconsin	207,165
Michigan	283,115
Total	674,870

The total sawlog drain in the Lake States amounted to 1,458 million board feet during the year. The sawlog drain was about 2 percent less than 1947 but 7 percent more than 1946.

The cut from saw-timber trees, including low-grade cord-wood material, amounted to 359 million cubic feet, about 4⅓ million cords, or 53 percent of the total drain. With the passing of each decade it becomes more evident that a smaller proportion of the total cut in the Lake States comes from sawlog trees.

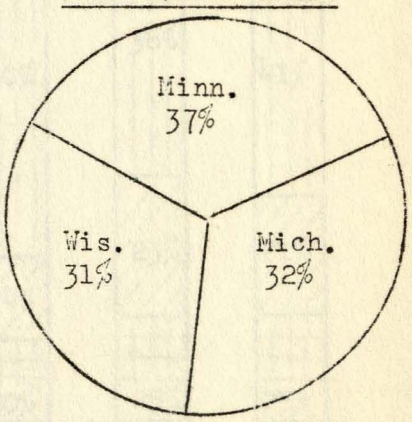
The cut from pole-sized trees amounted to 316 million cubic feet (4-1/3 million cords), representing 47 percent of the total drain. This trend is most pronounced in Minnesota where it is estimated that about 60 percent of the total drain in 1948 was comprised of material cut from trees of pole-timber size. The proportion was less in Wisconsin and Michigan, amounting to about 45 percent and 35 percent respectively.

Saw-timber Drain



M bd.ft. Int'l. ¼" Rule	
Minnesota	261,115
Wisconsin	438,000
Michigan	759,100
Total	1,458,215

Pole-timber Drain



M Cubic feet	
Minnesota	115,525
Wisconsin	98,120
Michigan	102,380
Total	316,025

Logs and bolts cut for lumber, boxboards, and railroad cross ties as a group ranked first as the largest single drain item. In 1948 these three closely related products made up 70 percent of the sawlog and 45 percent of the total cubic-foot drain. About 54 percent of the board-foot "lumber" drain was hardwoods, 36 percent softwoods, and 10 percent aspen.

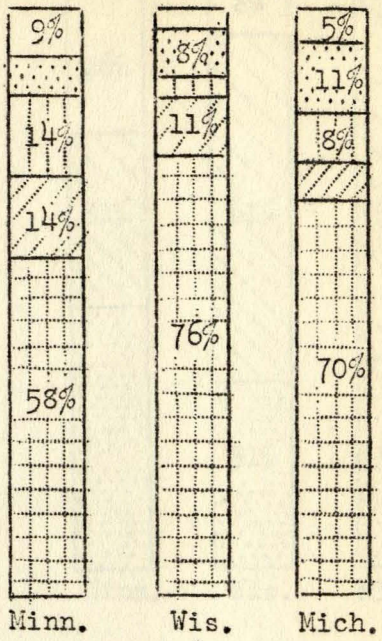
Pulpwood was second, accounting for nearly 170 million cubic feet or 25 percent of the total cubic-foot drain. Approximately two-thirds of the pulpwood drain in 1948 was in softwoods, and one-third in hardwoods. Use of hardwoods, particularly aspen, is on the increase and will be of more importance in the future.

Fuelwood, although two-thirds of it was nonmerchantable material, still ranked as the third largest drain item in the region, making up 9 percent of the sawlog and 18 percent of the total cubic-foot drain. Of the 124 million cubic feet of fuelwood drain, the volume was about equally divided between saw-timber and pole-timber trees. Hardwoods comprised about 65 percent, aspen 25 percent, and softwoods 10 percent of the fuelwood drain.

Of the other commodities, veneer logs and fence posts made up most of the remaining drain followed by mine materials, excelsior, chemical wood, poles, cooperage, and several other products.

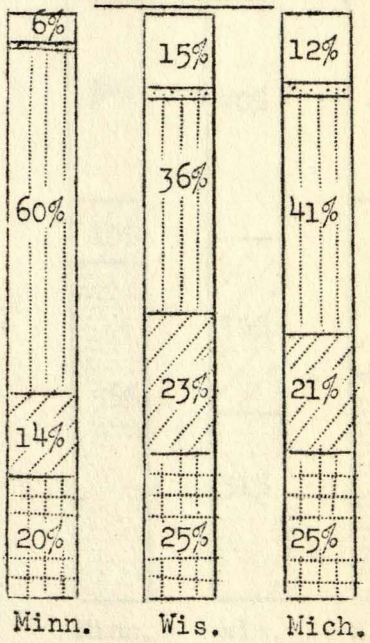
Drain by Commodities

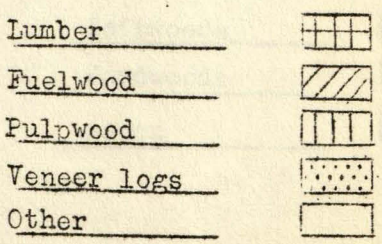
Saw Timber



Drain by Commodities

Pole Timber





Aspen, which accounted for about 22 percent of the total cubic-foot drain, was cut more heavily than any other species in the region. Maple, oak, and hemlock were next in order with 13, 12, and 9 percent respectively. However, in the board-foot saw-timber drain maple ranked first with approximately 302 million board feet, or 21 percent of the board-foot volume. Hemlock was second, accounting for 16 percent, oak third with 11 percent, and aspen fourth with 9 percent. In the pole-timber class, aspen was far out in front with nearly 110 million cubic feet (1½ million cords) representing 35 percent of the cut from pole-timber trees. Jack pine was second, accounting for 13 percent, oak and spruce tied for third with 10 percent each.
